

ABSTRACT OF THE DISCLOSURE

Methods and systems for screening a call are disclosed. Methods and systems consistent with the present invention screen calls. A first server receives information pertaining to a call to a user from a calling party. The first server then determines whether a real-time call management function is enabled for the user and determines whether a calling party number associated with the calling party is valid when the real-time call management function is not enabled. A call screening function is performed when the calling party number is invalid. The first server provides a notification of the call to a device associated with the user when the real-time call management function is enabled. A second server initiates the call screening function when the user selects a call screening option included in the notification.
